Abstracts

A traditional enterprise reporting platform includes capabilities to create trusted, sanctioned and highly controlled production reports and dashboards, which are then automatically distributed to large numbers of users in an enterprise and customers, or embedded in applications. It is most often deployed against a well-modelled data warehouse and/or data mart, including an optimization layer featuring online analytical processing (OLAP) cubes. It also requires a reusable semantic layer to give content authors consistent and governed access to data sources, metrics, and other data definitions such as hierarchies and groups. These platforms are designed to support modular development of IT-produced analytics content.
