Abstracts

Turbidity Sensors measure light passing through a sample of water. The light transmitted through the sample is dependent on the amount of soiled particles in the water. These devices are ideally suited for use in washing machines & dishwashers as well as other water purity type applications. As the particles increase, the light transmitted decreases. The measurement produced by the turbidity sensors enables the machine to run for shorter periods, generating energy savings for the consumer and long term environmental benefits.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Turbidity Sensors market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
