Abstracts

Underground utility mapping is a process of identifying the position and labelling public utility mains which are located underground. These mains may include lines for telecommunication, electricity distribution, natural gas, water mains and wastewater pipes. In some location, major oil and pipe lines, national defence communication lines, mass transit, rail and road tunnels also compete for space underground. Underground utility mapping refers to the detection, positioning and identification of buried pipes and cables beneath the ground. It deals with features mainly invisible to the naked eyes.

While the determination of position can be obtained with conventional or modern survey equipment, the detection and identification of underground utilities require special tools and techniques. Principally, underground utility mapping is the combination or marriage between two major fields of knowledge namely; geophysics and geomatics.
