Abstracts

A USB transceiver is usually a chip that implements the hardware parts of the USB protocol for a end device. Nowadays dedicated chips for this are not used much because USB peripherals are built into microcontrollers. The tighter coupling between the firmware and the USB peripheral allows for higher speed, easier interactions, no need for a external bus like SPI, and of course it all comes on a single chip. Take a look at the Microchip PIC 18F2550 as a example.
Some newer and larger micros have USB host or OTG (stripped down host) capability. A USB host is a lot more complicated than a USB device, so you generally will find this in micros with larger RAM and program memory, like some of the PIC 32 from Microchip for example.
Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the USB Transceiver market in 2020.
COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
This report also analyses the impact of Coronavirus COVID-19 on the USB Transceiver industry.
Based on our recent survey, we have several different scenarios about the USB
