## **Abstracts**

User virtualization is connected to the concept of desktop virtualization where the desktop environment is a virtual machine stored on a remote server. The key thing here is that there are two kinds of virtualized desktop infrastructure (VDI): Persistent and non-persistent VDI. Persistent VDI means that the virtual image on the user's desktop can be personalized with the addition of data, shortcuts, files, etc. Every time the user logs into the virtual machine, the image reflects changes made earlier. Non-persistent VDI is the opposite of that: Every time a user logs out, the computer reverts to its original state and the user sees the same image every time he or she logs in. The advantages of non-persistent images are that they are much easier to manage, require less storage, and are easier to patch and update.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the User Virtualization Software market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
