## **Abstracts**

Vulnerability management tools scan enterprise networks for weaknesses that may be exploited by would-be intruders. Should the scan find a weakness the vulnerability software suggests or initiates remediation action. In this way, vulnerability management software reduces the potential of a network attack. This approach to network security differs from firewalls, antivirus or antispyware software, and Intrusion Detection Systems (IDS). These security tools are designed to manage attacks on the network as they occur. In contrast, vulnerability management tools instead search for potential weaknesses and fix them in an attempt to mitigate potential future network attacks. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
