## Abstracts

This report focus on Wafer Probe Station market. Semiconductor Probing Systems are a well-established tool for testing circuits and devices on silicon wafers, dies, and open microchips. Probe stations allow a user to position electrical, optical or RF probes on a silicon wafer so that the device can be tested. These tests can be simple, such as continuity or isolation check, or sophisticated, including full functional testing of microcircuits. Tests can be run either before or after the wafer has been sawn into individual dies.

Testing at the wafer level allows a manufacturer to test a device multiple times during the production process, which may provide insight as to which process steps are introducing defects into the finished product. It also enables manufacturers to test the dies prior to packaging, which is important in applications where the packaging costs are high relative to the device costs.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Wafer Probe Station market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.

This report also analyses the impact of Coronavirus COVID-19 on the Wafer Probe
