Abstracts

A heat exchanger is a system used to transfer heat between two or more fluids. Heat exchangers are used in both cooling and heating processes. The spiral plate heat exchanger is made by rolling two long metal plates around a center core to form two concentric spiral flow passages, one for each fluid. The plate edges are welded shut so that each fluid stays within its own passage and there is no flow bypassing or intermixing.

The market is expected to be driven by the growing demand for the product in petrochemicals, HVAC & refrigeration, food & beverages, and chemical industries, especially in the emerging economies of Asia Pacific and CSA.
