Abstracts

Metal bellows are thin-walled cylindrical components used to mitigate vibration in the piping system when a media needs to be transported under pressure, where sealing a high vacuum is critical. The surface structure of metal bellows is in a corrugated form that offers flexibility during axial, lateral, and angular deformation. The bellows help in mitigating movement caused by thermal fluctuation, equipment movement, and vibration or pressure pulsation by converting movement into linear or rotational motion in any piping system. These bellows are used in a wide range of temperatures and pressure.

According to QYResearch's new survey, global Aerospace and Defense Metal Bellow market is projected to reach US\$ 1022.9 million in 2029, increasing from US\$ 659 million in 2022, with the CAGR of 6.5% during the period of 2023 to 2029.
