1 Air Core Inductor Market Overview

1.1 Product Overview and Scope of Air Core Inductor

An inductor is an electrical component used to store the energy resulting from current passing through it in a magnetic field. An inductor is made by wrapping a conducting wire into a coil around a central core, with each turn of the wire termed a winding. The number of windings in the coil is directly related to the inductance. Air core inductors use either non-magnetic coils or no coil at all instead of a ferromagnetic coil. The use of an air core ensures a lower peak inductance, but also reduces the energy losses associated with ferrite inductors. The lack of core losses allows air core inductors to be operated at high frequencies.
