Abstracts

Alginate casings are a natural product that are vegetable-based and are derived from brown algae species. These are the edible coatings that are useful to elongate the shelf life of different fruits, vegetables and poultry. Encapsulating the sausages provides a pleasant taste and a good texture to them. Alginate casings can be put to different uses that include alginate-based coatings and as a film in food packaging. It has various benefits like reducing dehydration, embellishing the product appearance, improvising the mechanical properties and controlling respiration.

According to QYResearch's new survey, global Alginate Casing market is projected to reach US\$ 1283.6 million in 2029, increasing from US\$ 812 million in 2022, with the CAGR of 6.8% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Alginate Casing market research.

The food packaging market is by far the largest application sector in the packaging industry, accounting for more than a third of the global packaging market. Dramatic changes in food habits and processed food preferences are driving the food packaging market. The packaged food market in North America and Western Europe has already reached an overall level, and rapid lifestyle changes and economic growth, coupled with population growth in Asia-Pacific countries (such as China and India), have caused the growth rate of food packaging in the region to soar. South America and the Middle East are also experiencing higher growth rates than developed countries. The main reason for the increased preference for processed foods is the shift in population dynamics from rural areas to urban centers. This has led to the emergence of dual-income urban households that prefer processed foods due to time constraints. Packaged foods have evolved from supermarkets to community stores in countries such as China, India, Brazil and Thailand. However, the market dynamics in North America and Europe are

controlled by the branding activities of food processing companies. The materials used for packaging food can also be segmented into plastic, paper and board, metal and glass. They can also be categorized by packaging material type as rigid, semi-rigid and flexible. The preference for different packaging materials also varies with region due to region-specific food habits.
