Abstracts

Food Preservatives are food additives that are used to enhance the shelf life of the food products besides maintaining the original taste, color, and aroma of the food product. These additives are responsible for controlling microbial growth which causes food spoilage. These may be synthetically derived or obtained from biological sources. Artificial preservatives may serve as antioxidants, reduce moisture content, make food more acidic, halt the ripening process, and inhibits the growth of micro-organisms, all of which help the food stay longer.

According to QYResearch's new survey, global Artificial Preservative market is projected to reach US\$ 4501.9 million in 2029, increasing from US\$ 2963 million in 2022, with the CAGR of 6.2% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Artificial Preservative market research.

Food additives promote the development of the food industry and have become an indispensable and important part of the modern food industry. There are many kinds of food additives. In China, there are 23 types of food additives allowed to be used, totaling more than 2,400 kinds of food additives. In Europe, there are more than 4,000 kinds of food additives allowed to be used. The U.S., EU and Japan are the major markets for food additives worldwide. According to our research, the global food preservatives market is approximately USD 34 in 2022. According to the China Food Additives and Ingredients Association, the total output of major varieties of food additives in China in 2021 was 14,840,700 tons, with sales of 139,923 million yuan.
