Abstracts

Automatic Direction Finder is an instrument that intercepts and uses electromagnetic radiation in the radio portion of the spectrum to determine the direction of the radio transmitter.

A direction finder (DF) can be used by an aircraft or ship as a navigational aid. This is accomplished by measuring the direction (bearing) of at least two transmitters whose locations are already known. When the measured directions from each transmitter are plotted on a map, the intersection of the two plotted lines gives the location of the aircraft or ship carrying the DF. This technique, using the directions to two or more transmitters of known location, is called triangulation.

The Major regions to produce automatic direction finder are United States, Germany and Japan, which accounting for more than 80 % of production value in total. Germany is the largest production region (production value share 40.07%). Direction Finder product demand is in a certain space, and the main consumer countries are moderately developed countries and developed countries.
