Abstracts

The brake booster is designed to create a greater braking force from minimum pedal effort, using a difference in atmospheric pressure and the engine's manifold vacuum. It increases the pedal force 2 to 4 times depending on the size of the diaphragm. The brake booster is located between the brake pedal and the master cylinder.

The Automotive Brake Booster mainly includes single diaphragm booster and dual diaphragm booster. The single diaphragm booster occupies most part of the production. The main production base is located in China, so China is the largest production region in the world.
