Abstracts

An oil pan is a component that typically seals the bottom side of four-stroke, internal combustion engines in automotive and other similar applications. While it is known as an oil pan in the U.S., other parts of the world may call it an oil sump. Its main purpose is to form the bottommost part of the crankcase and to contain the engine oil before and after it has been circulated through the engine. When an oil pan is removed, some components revealed usually include the crankshaft, oil pickup, and the bottom end of the dipstick. Some oil pans will also contain one or more magnets that are designed to capture small pieces of metal before they can plug the oil filter or damage the engine. In past, automotive oil pan industry booms, production increased. The average growth rate of global production is about 4%?

In recent years, production growth rate was slowing down. And it will increase in low speed in short time.

As a side product of car industry and parking space, the development is affected completely by their development.

Development and popular level of new energy industry will affect the automotive oil pan industry in future.
