Abstracts

Awning fabrics are very different from other textiles. They have an advanced set of properties which allow them to withstand annual changes in temperature, along with the other challenges posed by life outdoors, including UV lightening and damage caused by rain or dirt. They are strong enough to resist tearing effectively, even on seams and hems, and stay taut despite being opened and closed thousands of times.

Awnings were once made from canvas. Acrylic was a synthetic alternative which replaced canvas in the early 1960s, while polyester arrived in recent years using environmentally-conscious manufacturing processes. Acrylic looks and feels like canvas, while polyester has a thinner, flatter texture with a matt surface. Polyester's more recent development meant a high-tech composition, with advantages in terms of strength, light fastness, UVA and UVB projection and nano-coatings. Acrylic has developed and now offers similar properties in these areas. Therefore the main difference is in the texture and feel of the fabric. Synthetic awning fabric is generally made from vinyl, acrylic, polyester, or a combination of any of the three. The way that synthetic fabric is formed and how it is coated, backed, and dyed will all make a difference in how it performances.

In the coming years there is an increasing demand for Awnings Fabric in the regions of North America, Europe and Asia-Pacific.

In the past few years from 2012-2017, the global production and consumption developed stably.
