Abstracts

Iron powder is formed as a whole from several other iron particles. The particle sizes vary anywhere from 20-200 μ m. The iron properties differ depending on the production method and history of a specific iron powder. There are three types of iron powder classifications: reduced iron powder, atomized powder, and electrolyte iron powder. Each type is used in various applications depending on their properties. There is very little difference in the visual appearances of reduced iron powder and atomized iron powder.

Carbonyl iron is a highly pure (97.5% for grade S, 99.5+% for grade R) iron, prepared by chemical decomposition of purified iron pentacarbonyl. It usually has the appearance of grey powder, composed of spherical microparticles. Most of the impurities are carbon, oxygen, and nitrogen.

Ultra Fine Iron Powder, in our report, refers to iron powder's particle size is smaller than 10 μ m. Ultrafine iron powder has smaller particles, which has a very good electrical magnetic optical effect. This not only affects the sintering properties of the material, but also the final physical properties of the material. Ultrafine iron powder is widely used in the field of electromagnetic shielding & powder metallurgy.

The production process of carbonyl iron powder (CIP) was discovered by BASF in 1925. Currently, there are only a few countries that are able to produce carbonyl iron powders in the world, which mainly include Germany, China, America and Russia. According to the data, the carbonyl iron powder production in the world in 2016 was 18 K MT.

Leading players in carbonyl iron powder (CIP) industry are BASF, Jiangsu Tianyi, Jilin Jien and Sintez-CIP. Among them, BASF is the tycoon of CIP with 12000 MT capacity in 2016.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019
