## Abstracts

Chelants, also known as chelating agents, complexing, or sequestering agents, are compounds that are able to form stable complexes with metal ions.

Chelants achieve this by coordinating with metal ions at a minimum of two sites, thus solubilizing and inactivating the metal ions that would otherwise produce adverse effects in the system on which they are used.

The technical barriers of chelants are relatively not high, resulting in numerous manufacturing enterprises. In the market, there are some relatively large enterprises, such as BASF, AkzoNobel, Fuyang Biotech, Dow, Dongxiao Biotech, Kaixiang BioChem, Taihe Chem, Huiyang Biotech, PMP, AVA Chemicals, and others.

Biodegradable chelating agents are likely to capture a significant share of the chelating agents market in the coming years, especially in EU and USA, owing to potential health and environmental hazards associated with non-biodegradable organic chelating compounds.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
