Abstracts

Chemical Mechanical Polishing Pad is a product which increases semiconductor integration by smoothening the semiconductor wafer surface through physical and chemical polishing processes.

According to QYResearch's new survey, global Chemical Mechanical Polishing Pads market is projected to reach US\$ 1382.3 million in 2029, increasing from US\$ 882 million in 2022, with the CAGR of 6.6% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Chemical Mechanical Polishing Pads market research.

Global giant manufactures mainly distributed in USA, Japan and Taiwan. It has unshakable status in this field. At present, considering the cost and the influence of the size of silicon wafers on the performance and efficiency of integrated circuits, the increase in the size of wafers is an inevitable trend and a mainstream trend, in particular, 8-inch and 12-inch. Wafer may develop in the direction of 18 inches in the future. However, the larger the size, the more difficult it is to produce the corresponding CMP pad. When the downstream size becomes an inevitable trend, in order to occupy the market, it is necessary to be able to develop large-size pad, otherwise it will be eliminated by the market. With the expectation of the superior performance improvement of integrated circuits, the polishing performance of CMP pads has to be increased, so its performance in the future must be more stringent. China Taiwan is the largest consumption region of CMP Pads in volume. The second place is South Korea; following China Taiwan in 2022.
