Abstracts

Seals used in the chemical transportation industry are majorly made from either polytetrafluoroethylene (PTFE) or perfluoroelastomer (FFKM) or ethylene propylene diene monomer (EPDM). These materials provide exceptional durability, excellent wear resistance, and outstanding chemical resistance against a wide range of chemicals. These seals are mainly used in the form of o-rings and gaskets in tankers to prevent any non-accidental releases (NARs) during the time of chemical transportation. Stringent regulations to prevent non-accidental releases of chemicals during the transportation is a factor assuring a healthy demand for seals in chemical transportation.

According to QYResearch's new survey, global Chemical Transportation Seal market is projected to reach US\$ 2584 million in 2029, increasing from US\$ 1693 million in 2022, with the CAGR of 6.3% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Chemical Transportation Seal market research.

Chemical is an important driver of this industry. Emerging economies, particularly in Asia and Latin America, are experiencing rapid industrialization, urbanization, and population growth. This drives the demand for bulk chemicals across various sectors, including construction, automotive, electronics, agriculture, and consumer goods. The rising middle class in these regions is also contributing to increased consumption of chemical products.
