## Abstracts

Chloroacetic acid, also called Chloroacetic acid (MCA), is a bi-functional molecule-structured acid. At room temperature, pure MCA is a colorless, deliquescent crystalline mass. It is very soluble in water, freely soluble in methanol, ethanol, isopropanol, diethyl ether and acetone. It is extensively used as a chemical intermediate for the production of numerous industrially and commercially important chemicals, including glycine, CMC, TGA, and cyanoacetic acid. It is also used in the production of betaine-type surfactants, synthetic caffeine, and vitamins, and the production of 2, 4-D and methanoates for using in herbicides. MCA is commercially produced through the chlorination of acetic acid during the production of acetic anhydride as a catalyst.

MCA is marketed in various forms: as a solid (powder or flakes), in molten form (kept at a temperature > 80°C) or as 80% dilution in water. For these forms of packaging, exposure estimates are made.

MCA downstream is wide and the major fields are carboxymethyl cellulose (CMC), agrochemical, surfactants and thioglycolic acid (TGA). CMC is acting as a major driving force for the growth of the global chloroacetic acid market. The growth of the CMC market is further being augmented by the increased demand for CMC for oil drilling operations from the oil and gas industry in USA and the Middle East.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
