## Abstracts

Chloroprene rubber (hereinafter: CR; synonym: polychloroprene or sometimes Neoprene) is a synthetic rubber produced by polymerization of chloroprene. It is an artificially-made polymer acting as an elastomer. Chloroprene rubber exhibits good chemical stability, and maintains flexibility over a wide temperature range. It is used in a wide variety of applications, such as laptop sleeves, orthopedic braces (wrist, knee, etc.), electrical insulation, liquid and sheet applied elastomeric membranes or flashings, and automotive fanbelts.

Major manufacturers of chloroprene rubber is mainly in Japan, Europe and China. And production in Europe can be gradually shifted to Japan.

There are only 11 manufacturers all over the world. In the future, it is likely that the chloroprene rubber business will not expand.

Due to backward technology, China chloroprene rubber is not dominant in international trade.

Japan chloroprene rubber price is not high. As the DuPont chloroprene rubber business is sold to Japanese companies, Japan is expected to occupy most market share in global.

Chloroprene rubber process costs high and pollutes the environment, also the alternative product EPDM is much cheaper than chloroprene rubber, therefore Chloroprene rubber products tend to shrink in the future.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
