## Abstracts

Climate Chambers are environmental testing devices used for various types of testing such as prototype evaluation, research & development testing, production testing, accelerated stress testing, reliability testing, failure analysis, and any other application where environmental simulation is needed.

An environmental test chamber artificially replicates the conditions under which machinery, materials, devices or components might be exposed. It is also used to accelerate the effects of exposure to the environment, sometimes at conditions not actually expected.

Worldwide, the total production volume of climate chambers reached 20074 units and the volume is forecasted to reach about 25262 units by the end of 2021. Over the past five years, the global market of climate chamber experienced a growth rate of about 4.04% in units.
