Abstracts

Polymyxin E, is an antibiotic produced by certain strains of the bacteria *Paenibacillus polymyxa*. Colistin is a mixture of the cyclic polypeptides colistin A and B and belongs to the class of polypeptide antibiotics known as polymyxins. Colistin is effective against most Gram-negative bacilli.

According to QYResearch's new survey, global Colistin market is projected to reach US\$ 54 million in 2029, increasing from US\$ 58 million in 2022, with the CAGR of -1.4% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Colistin market research.

The polymyxin market is driven by the increasing prevalence of multidrug-resistant bacterial infections and the limited availability of effective treatment options. Polymyxins, specifically polymyxin B and polymyxin E (colistin), are considered as last-resort antibiotics for treating infections caused by Gram-negative bacteria, including those resistant to other antibiotics. The emergence of drug-resistant bacterial strains, such as carbapenem-resistant Enterobacteriaceae (CRE) and *Pseudomonas aeruginosa*, has highlighted the importance of polymyxins in clinical practice. However, challenges include the potential for nephrotoxicity and neurotoxicity associated with polymyxin use, which can limit their clinical utility and raise concerns about patient safety. The development of new formulations and combination therapies to enhance the efficacy and reduce the side effects of polymyxins, as well as addressing the growing issue of antibiotic resistance, will be essential in shaping the future of the polymyxin market.
