Diabetes is a metabolic disorder that affects your pancreas ability to produce or use insulin. Insulin is a hormone secret by the beta cell of the islet of Langerhans of the pancreas. When your body turns the food which u eat into energy molecule glucose. In response to glucose, body secretes insulin which helps to transport glucose/energy to the cells. Insulin acts as a key to remaining energetic. It is a chemical message that tells the cell to open and receive glucose. If the body produces little or no insulin or are insulin resistant, too much sugar remains in your blood. Blood glucose levels are higher than normal for individuals. This results in diabetes. There are two main types of diabetes: Type 1 and Type 2. Type 1 is also known as insulin dependent diabetes mellitus whereas type 2 is known as noninsulin dependent diabetes mellitus.

Diabetes is a metabolic disorder that affects your pancreas ability to produce or use insulin. Diabetes currently affects 386 million people worldwide and is expected to increase to 592 million people by 2035. The diabetes prevalence is growing with rising obesity rates, lifestyle and dietary changes, and growing ageing population.
