## Abstracts

E-waste recycling industry refers to the work or business contains the collecting, transporting, re-using or processing of e-waste.

As the electronics industry is developing rapidly worldwide, the volume of electronic equipment generated is increasing in amazing speed, as well as the e-waste. These e-wastes contain lot of valuable materials or equipment that can be recycled. And e-waste also contains toxic and hazardous materials including mercury, lead, cadmium, beryllium, chromium, and chemical flame retardants, which have the potential to leach into our soil and water.

Currently, the volume of e-waste that can be recycled properly is less than 20% of the total volume of e-waste generated worldwide each year. There is still quite a lot of work should be done to promote the development of e-waste recycling industry.

Growing numbers of governments are beginning to make laws or taking more strict measures to restrict the incineration or fill of e-waste and try to ban undocumented workshops of e-waste recycling.

As the recycling and processing technology of e-waste is developing, the e-waste is getting re-used more properly and deeply. The cost of recycling and processing of e-waste is reducing, and the profit level of authorized e-waste recycling enterprises is increasing.

Although recycling and processing of e-waste may bring a lot of opportunities to related enterprises, the study group recommends that new entrants those just have money but without technical advantage do not enter into the e-waste recycling industry.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
