Abstracts

This report studies the global Erythropoietin market status and forecast, categorizes the global Erythropoietin market size (value & volume) by manufacturers, type, application, and region. This report focuses on the top manufacturers in North America, Europe, Japan, China, India, Southeast Asia and other regions (Central & South America, and Middle East & Africa).

Erythropoietin is produced by interstitial fibroblasts in the kidney in close association with peritubular capillary and proximal convoluted tubule. It is also produced in perisinusoidal cells in the liver. While liver production predominates in the fetal and perinatal period, renal production is predominant during adulthood.

Erythropoietin is an essential hormone for red blood cell production. Without it, definitive erythropoiesis does not take place. Under hypoxic conditions, the kidney will produce and secrete erythropoietin to increase the production of red blood cells by targeting CFU-E, proerythroblast and basophilic erythroblast subsets in the differentiation.

Erythropoietin has its primary effect on red blood cell progenitors and precursors (which are found in the bone marrow in humans) by promoting their survival through protecting these cells from apoptosis, or cell death.

In this report, we definite one unit for 1ml, except Epoetin-alfa type, which one unit means 10000units/ml

The classification of erythropoietin includes epoetin-alfa, epoetin-beta, darbepoetin-alfa and others. The proportion of epoetin-alfa in 2016 is about 58.53%.

Erythropoietin is widely used for anemia and kidney disorders. The most proportion of Erythropoietin used in Kidney Disorders, and the market share in 2016 is 45.91%.

The global Erythropoietin market is valued at 7240 million US\$ in 2017 and will reach 10700 million US\$ by the end of 2025, growing at a CAGR of 5.8% during 2018-2025.
