Abstracts

Gilenya is an immunomodulating drug, mostly used for treating multiple sclerosis (MS). Fingolimod is a sphingosine-1-phosphate receptor modulator, which sequesters lymphocytes in lymph nodes, preventing them from contributing to an autoimmune reaction.

According to QYResearch's new survey, global Gilenya market is projected to reach US\$ 934.9 million in 2029, increasing from US\$ 2013 million in 2022, with the CAGR of -8.7% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Gilenya market research.

The Gilenya market is primarily driven by the growing demand for effective treatments for multiple sclerosis (MS), particularly relapsing forms of the disease. Gilenya (fingolimod) is an oral medication that modulates immune system responses, aiming to reduce relapses and slow down disease progression. The increasing prevalence of MS and the need for therapies that offer convenience and improved quality of life contribute to market growth. Moreover, the shift from injectable to oral treatments and the potential to decrease relapse rates further propel adoption. However, challenges include potential cardiac effects during the initial dose and the need for monitoring patients for safety. Navigating the competitive landscape of MS treatments and addressing affordability and access barriers for a wider patient population are ongoing concerns. The market's success hinges on continuous research to enhance safety profiles, comprehensive patient education about potential benefits and risks, and collaborations between pharmaceutical companies, healthcare providers, and MS patient organizations to optimize MS management while addressing the evolving challenges associated with Gilenya therapy.
