## Abstracts

Gear grinding is the name of a specific gear creation technique. Grinding involves the removal of unwanted materials through an abrasion process. Grinding is typically the last step in the gear creation process; other techniques have removed the majority of the material first. There are several methods of grinding, but not all of them are used for the creation of gears. In addition to the gear creation meaning, gear grinding is the common term for incorrectly shifting a manual transmission vehicle.

For industry structure analysis, the Gear Grinding Machine Industry is concentrate. The top five producers account for about 67% of the revenue market. Regionally, Europe is the biggest production area of Gear Grinding Machine, also the leader in the whole Gear Grinding Machine.

Europe occupied 34.91% of the production market in 2017. It is followed by China and United States, which respectively have around 21.15% and 18.60% of the global total industry. Other countries have a small amount of production.

In 2017, the global sales volume of the Gear Grinding Machine reaches over 1000 Unit; the gross margin is around 32% during the last five years. Geographically, China occupied 28.08% of the sales volume market in 2017. It is followed by Europe and North America, which respectively have around 22.97% and 20.33% of the global total industry.

For price trend analysis, a key variable in the performance of Gear Grinding Machine producers is raw material costs, specifically the speed at which any increase can be passed through to customers.

For forecast, the global Gear Grinding Machine revenue would keep increasing with annual growth rate with 2~5%, and a little higher speed in India. We tend to believe that this industry still has a bright future, considering the current demand of Gear Grinding Machine. As for product prices, the slow downward trend in recent years will continue in the next few years, as competition intensifies. Similarly, there will be fluctuations in

gross margin.
