## Abstracts

Peripheral guidewires have multiple layers which includes central core, distal tip and outer coating. Central core is generally made up of stainless steel or nitinol which possess superior torque characteristics. Distal tip has variable length and it is made up of radio-opaque material e.g. platinum or iridium alloys and provides flexibility during operations. Peripheral guidewires are coated with a polymer, such as silicone or polytetrafluoroethylene (PTFE), to increase lubricity. Peripheral guidewires are used during the percutaneous transluminal angioplasty and angiography for guiding the stents or catheters to the site of action in the peripheral vasculature.

Peripheral guidewire market is mainly driven by increasing demand for minimally invasive surgeries. Other important factor that propels the market growth is increasing worldwide geriatric population. Moreover, growing incidences of neurological, cardiovascular and urology disorders also fuel the market growth. It is important for patients to fully understand the risks of the procedure undergoing laparoscopy and other cardiovascular, neurovascular surgeries. Some risk factors associated with of minimally invasive surgery and preference given to open surgery may hamper the growth of this market.

The Guide Wire industry concentration is relatively high; there are just not much manufacturers in the world, and mainly from Japan and USA.

Global giant manufactures mainly distributed in Japan and USA. The manufacturers in Japan have a long history and unshakable status in this field. In Europe, TE Connectivity acquired AdvancedCath and definitive agreement to acquire Creganna, thus leads the technology development. Most of Chinese manufactures are not professional producers, that make their products have lower market recognition, even in China domestic market.
