Abstracts

According to our research report, the global helicobacter pylori diagnostics market will grow at a CAGR of more than 7.4% during the forecast period. One of the key drivers witnessed in the market is the growing cost-effectiveness of diagnosis and personalized antibiotic therapy. H. pylori bacteria causes ulcer. H. pylori infection requires antibiotic therapy that includes 10-14 days treatment regimen. This treatment regimen comprises of one or two antibiotics such as amoxicillin, tetracycline, metronidazole, or clarithromycin in combination with ranitidine bismuth citrate, bismuth subsalicylate, and a proton pump inhibitor (PPI). Ulcer-related symptoms such as abdominal pain and nausea and inflammation of gastric mucosa can be cured using PPIs or H2 blockers in combination with antibiotics. The cost-effectiveness of antibiotics and the lesser duration of treatment boosts the adoption of antibiotic regimen by healthcare professionals. This in turn, will drive the demand for pre- and post-monitoring tests.
