## Abstracts

Hemostasis is a process which causes bleeding to stop, meaning to keep blood within a damaged blood vessel (the opposite of hemostasis is hemorrhage). It is the first stage of wound healing.

Tissue sealing agents are used during medical procedures to achieve hemostasis. They vary based on their mechanism of action, composition, ease of application, adherence to tissue, immunogenicity and cost. These agents permit rapid hemostasis, better Visualization of the surgical area, shorter operative times, decreased requirement for transfusions, decreased wound healing time and overall improvement in patient recovery time.

The classification of Hemostasis and Tissue Sealing Agents includes Hemostasis and Tissue Sealing Agents and the revenue proportion of Hemostasis Agent in 2017 is about 64%
