1 Hot Swap Controller Market Overview

1.1 Product Overview and Scope of Hot Swap Controller

Hot Swap controllers allow electronic circuit boards and cards to be inserted into live system backplanes, eliminating the need to power them down. Mission critical systems, such as servers and communication equipment, operate continuously as boards are hot plugged in or pulled out, either for system maintenance or to adjust load handling capacity. The basic functions of a Hot Swap controller are inrush current control and fault isolation. When boards are plugged in, the Hot Swap controller detects power first, then ramps up the board's capacitors gently, avoiding connector sparks, backplane supply glitches and system resets. On a downstream short-circuit fault, the controller's

electronic circuit breaker shuts off power to the card, preventing the fault from propagating upstream to the rest of the system. Being the gateway to board power, Hot Swap Controllers have evolved from these two basic functions to also providing sophisticated board power monitoring via digital measurements of the current and voltage levels by integrated ADCs, accessible through I2C/SMBus interfaces.
