Human papilloma virus (HPV) vaccines are vaccines that prevent infection by certain types of human papillomavirus. Available vaccines protect against either two, four, or nine types of HPV. All vaccines protect against at least HPV type 16 and 18 that cause the greatest risk of cervical cancer. It is estimated that they may prevent 70% of cervical cancer, 80% of anal cancer, 60% of vaginal cancer, 40% of vulvar cancer, and possibly some mouth cancer. They additionally prevent some genital warts with the vaccines against 4 and 9 HPV types providing greater protection.

HPV vaccine is an inactivated (not live) vaccine which protects against four major types of HPV. These include two types that cause about 70% of cervical cancer and two types that cause about 90% of genital warts. HPV vaccine can prevent most genital warts and most cases of cervical cancer. Human papillomaviruses (HPVs) are a group of more than 200 related viruses. More than 40 HPV types can be easily spread through direct sexual contact, from the skin and mucous membranes of infected people to the skin and mucous membranes of their partners. They can be spread by vaginal, anal, and oral sex (1). Other HPV types are responsible for non-genital warts, which are not sexually transmitted. The segment of Female HPV vaccine market witnessed growth at a noteworthy rate over the past few years and is expected to grow in the forecast period on the back of rising awareness regarding HPV related fatal diseases, rising healthcare expenditures along with rising disposable incomes. North America and Europe accounts for the maximum market share of the global HPV vaccines market and is expected to grow at highest CAGR during the forecast period.
