## Abstracts

Icotinib (trade name Conmana) is a highly selective, first generation epidermal growth factor receptor tyrosine kinase inhibitor (EGFR-TKI). Icotinib is approved for use as first-line monotherapy in patients with non-small-cell lung cancer with somatic EGFR mutations.

According to QYResearch's new survey, global Icotinib market is projected to reach US\$ 28 million in 2029, increasing from US\$ 15 million in 2022, with the CAGR of 8.6% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Icotinib market research.

The Icotinib market is primarily driven by the demand for targeted therapies in the treatment of non-small cell lung cancer (NSCLC). Icotinib is a medication used as a tyrosine kinase inhibitor for patients with advanced NSCLC that carries EGFR mutations. The increasing prevalence of lung cancer, particularly among non-smokers and those with specific genetic mutations, contributes to market growth. Moreover, advancements in personalized medicine and the demonstrated efficacy of Icotinib in improving progression-free survival further propel adoption. However, challenges include managing the cost of targeted therapies and addressing potential drug resistance or adverse effects. Navigating patient access issues, optimizing treatment sequencing, and ensuring long-term safety are ongoing concerns. The market's success relies on continuous research in lung cancer treatment, collaborations between pharmaceutical manufacturers and oncologists, and comprehensive patient education on the benefits and potential risks of Icotinib treatment while addressing the evolving challenges associated with precision oncology and cancer treatment accessibility.
