## Abstracts

Inductive position sensors are used to detect the presence of nearby objects without touching them physically. These sensors are embedded in machineries for machine vibration monitoring. This helps in measurement of variation in the distance between the shaft and its support bearing. These sensors are in demand due to the increasing demand for automated machineries in various industries such as automotive, food and beverages and process industries among others. In addition, the price of these sensors are falling drastically which is acting as a driver of this market.
