Abstracts

Insulin glargine, marketed under the names Lantus among others, is a long-acting basal insulin analogue, given once daily to help control the blood sugar level of those with diabetes. It consists of microcrystals that slowly release insulin, giving a long duration of action of 18 to 26 hours, with a 'peakless' profile (according to the insulin glargine package insert).

Insulin glargine is a long-acting, man-made version of human insulin. Insulin glargine works by replacing the insulin that is normally produced by the body and by helping move sugar from the blood into other body tissues where it is used for energy. It also stops the liver from producing more sugar.

There are two types of Insulin glargine, which are Single Dose Vial and Pre-filled Syringe in the market. Considering its function, Insulin glargine is used to treat type 1 diabetes (condition in which the body does not produce insulin and therefore cannot control the amount of sugar in the blood). It is also used to treat people with type 2 diabetes (condition in which the body does not use insulin normally and, therefore, cannot control the amount of sugar in the blood) who need insulin to control their diabetes.

We can see that there are just a few companies produce Insulin glargine, the production of them almost approach to 70% of whole market. They have set plant in Japan, China, Germany, India, North America to produce Insulin glargine, and China is the largest plant for Insulin glargine in the world and also the largest consumption country. As the amount of diabetes of increasing of China, the Chinese market will be bigger than North America.
