Abstracts

Layered Double Hydroxide(CAS 11097-59-9) is a layered double hydroxide of general formula $Mg_6Al_2CO_3(OH)_{16} \cdot 4(H_2O)$, whose name is derived from its resemblance with talc and its high water content. The layers of the structure stack in multiple ways, to produce a 3-layer rhombohedral structure (3R Polytype), or a 2-layer hexagonal structure (2H polytype) formerly known as manasseite. The two polytypes are often intergrown. The carbonate anions that lie between the structural layers are weakly bound, so hydrotalcite has anion exchange capabilities.
