Abstracts

The horticulture waste could be used to extract the lignin which could then be converted in bio-char. Pre-treatment and post treatment of biochar is extensively done to reduce the impurities and to enhance the overall purity of the lignin based graphene. Graphene from lignin could be produced utilizing two sequential processes, thermal treatment and degradation of lignin. In degradation process, carbon growth is done followed by exfoliation. Post degradation, lignin is thermally treated to enhance the carbon content and to tear down the complex structure of the lignin.

According to QYResearch's new survey, global Lignin-Based Graphene market is projected to reach US\$ 656.6 million in 2029, increasing from US\$ 423 million in 2022, with the CAGR of 6.5% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Lignin-Based Graphene market research.

Chemical is an important driver of this industry. Emerging economies, particularly in Asia and Latin America, are experiencing rapid industrialization, urbanization, and population growth. This drives the demand for bulk chemicals across various sectors, including construction, automotive, electronics, agriculture, and consumer goods. The rising middle class in these regions is also contributing to increased consumption of chemical products.
