Abstracts

This report studies the global LNG Bunkering market status and forecast, categorizes the global LNG Bunkering market size (value & volume) by key players, type, application, and region.

This report focuses on the top players in North America, Europe, China, Japan, Southeast Asia India and Other regions (Middle East & Africa, Central & South America).

Liquefied natural gas (LNG) is natural gas (predominantly methane, CH₄) that has been converted to liquid form for ease of storage or transport.

LNG is an attractive fuel choice for many vessels because it exceeds the air quality standards set forth. It takes up about 1/600th the volume of natural gas in the gaseous state. It is odorless, colorless, non-toxic and non-corrosive. Hazards include flammability after vaporization into a gaseous state, freezing and asphyxia.

The liquefaction process involves removal of certain components, such as dust, acid gases, helium, water, and heavy hydrocarbons, which could cause difficulty downstream. The natural gas is then condensed into a liquid at close to atmospheric pressure by cooling it to approximately -162 °C (-260 °F); maximum transport pressure is set at around 25 KPa (4 psi).

LNG Bunkering is a particular type of operation where LNG fuel is transferred from a given distribution source to a LNG fuelled ship. It involves the participation of different stakeholders, from the ship-side, LNG supplier, ports, safety personnel, administrations and policy makers. In this report, LNG bunkering only refers to LNG bunkering fuel.

The International Maritime Organization has established regulations on the fuel sulphur content of ship fuels and set mandatory NO_x emission limits for new-build engines.

These regulations are implemented through the IMO's International Convention for the Prevention of Pollution from Ships (MARPOL). In addition to these engine and fuel requirements, certain areas have also been designated as emission control areas where stricter emissions limits are enforced. Besides air quality measures the IMO is also introducing instruments to monitor and reduce GHG emissions from shipping.

The US EPA has implemented MARPOL Annex VI in its national legislation NOx and sulphur emission control areas The US EPA has also introduced a “Ports Initiative” to look at protecting human health, addressing climate change and supporting economic growth. The state of California has also adopted several state-specific regulations. The Clean Fuel Regulation for Ocean Going Vessels regulates the fuel sulphur content of ship fuels used by vessels within 24 nautical miles of the California coast. The At-Berth Regulation requires vessels to plug into shore power or use alternative controls to meet emission reduction requirements.

The European Union’s Fuel Sulphur Directive implements MARPOL Annex VI in EU legislation. Non-EU countries like Norway and Russia have likewise implemented Annex VI in national legislation. In addition, the EU is promoting the use of LNG as a ship fuel. To this end, an EU proposal on alternative fuel infrastructure aims to guarantee sufficient infrastructure in the form of LNG bunkering stations and terminals, while at the same time provide subsidies via the TEN-T fund to develop and further improve such infrastructure.

The global LNG Bunkering market is valued at 1200 million US\$ in 2017 and will reach 61100 million US\$ by the end of 2025, growing at a CAGR of 63.5% during 2018-2025. The major players covered in this report
