A damper (otherwise known as a louvre) is a multi-element flow control device generally used to throttle large flows of air at low pressure. Louvers are used on air intake or exhaust where protection from water infiltration is required. They have fixed blades that do not close so if the application requires air shutoff, a combination damper/louver is recommended.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Louvers and Dampers market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
