Abstracts

Nanocellulose is a term referring to nano-structured cellulose. This may be either cellulose nanofibers (CNF), also called microfibrillated cellulose (MFC), nanocrystalline cellulose (NCC or CNC), or bacterial nanocellulose, which refers to nano-structured cellulose produced by bacteria.

Nanocellulose is produced from plant/tree through cellulose extraction or cellulose derived from bacteria via a culture medium.

Some parameters of nanocelluloses are as follows:

Diameter: 5 nm - 500 nm. Length: 10s nm - 100s μm.

Specific surface area: 10s - 100s of m2/g.

Nnanocellulose have many special properties, such as Natural & renewable, Biodegradability, Biocompatibility, High strength & modulus, High surface area, High aspect ratio, Chemical functionality (e.g. for modification), Dimensional stability, Moisture absorption, Thermal stability (~200°C), etc.

In the future, the production and consumption is estimated to continue developing with a relatively high growth rate. To meet the large and increasing demand, more and more manufacturers will go into this industry. End industries such as automobiles, paper & pulp industry and so on.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Microbial and Bacterial Cellulose 3900 market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
