The Microturbine generates power and is a combination of a small gas turbine and high speed generator. The combustor in a microturbine can run on various types of fuel such as diesel, natural gas, biogas, alcohol, hydrogen, and LPG, emitting negligible toxicity.

Microturbines can generate

As international economic situation is complicated, in the next few years there will be many uncertainties although. Due to the government' policy and the high production of PCB etc. in the international market, the current demand for Microturbines product is relatively high in the mature market, such as Europe and North America, but the demand in China is relatively higher due to the downstream demand.

In 2014, the global production of the Microturbines reaches over 1983 Unit.

Microturbines are mainly produced by Capstone, and these companies occupied about 35.5% market share in 2014.

Europe, America are major consumption regions in Microturbines production market.

Although sales of Microturbines brought a lot of opportunities, the study group recommends the new entrants who just having money but without technical advantage and downstream support, do not to enter into the Microturbines field hastily.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
