Abstracts

Mixed-mode chromatography resin refers to the interactions or mixed-mode media used in this chromatographic method. Mixed-mode chromatography materials contain ligands of multimodal functionality that allow protein adsorption by a combination of ionic interactions, hydrogen bonds, and/or hydrophobic interactions. Complex mixtures like fermentation supernatants or cell lysates can be applied directly at relatively high conductivity, and elution is usually achieved by electrostatic charge repulsion. In 2015, the global mixed-mode chromatography resin production market is led by Europe; USA is the second-largest region-wise market. At present, the major manufacturers of mixed-mode chromatography resin are concentrated in Europe (Pall) and USA. Pall is the world leader, holding 50.5% production market share in 2015. Currently, the US is the world's largest consumer market. US hold 45.82% share of the global consumption market.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
