The MMR vaccine (also known as the MPR vaccine after the Latin names of the diseases) is an immunization vaccine against measles, mumps, and rubella (German measles). It is a mixture of live attenuated viruses of the three diseases, administered via injection. It was first developed by Maurice Hilleman while at Merck.

Measles, mumps, and rubella are the three common contagious airborne diseases that are highly caused by virus transmitted by sneezing and coughing of the infected person, which could lead to serious complications or death among children. Vaccines of these diseases are sold as attenuated viral vaccines, manufactured in a lyophilised formulation, which requires reconstitution with water for injection diluent and are available in two forms i.e. monovalent as well as combinational vaccines. Combinational MMR vaccines comprises mixture of two or more viral strains. These measles, mumps, and rubella vaccines are administered by subcutaneous injection to children as well as adults.
