Mechanical Vapor Re-Compression (MVR), sometimes referred to as Mechanical Vapor Compression (MVC), is a highly efficient process using mechanical energy input to achieve evaporation and condensation. The fundamental difference between the vapor compression unit and the conventional evaporator is that the latent heat of vaporization is fully utilized in the vapor compression evaporator. Since the evaporator also serves as the condenser, essentially all of the latent heat is recycled, with no rejection of heat to cooling water. The evaporation takes place on a thin-film heat transfer surface where steam condenses on one side and water boils on the other side.

As Chinese overall economic downward trend in the past few years, and international economic situation is complicated, in the next few years there will be many uncertainties, and coupled with MVR Evaporator industry in short supply on the market in the past few years, more and more companies enter into MVR Evaporator industry, the current demand for MVR Evaporator product is relatively low, lack of demand, excess supply.
