Abstracts

Nisin is a polycyclic antibacterial peptide produced by the bacterium *Lactococcus lactis* that is used as a food preservative. It has 34 amino acid residues, including the uncommon amino acids lanthionine, methyllanthionine, didehydroalanine, and didehydroaminobutyric acid.

According to QYResearch's new survey, global Nisin for Food market is projected to reach US\$ 259 million in 2029, increasing from US\$ 193 million in 2022, with the CAGR of 4.4% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Nisin for Food market research.

The demand for nisin in the food market is primarily driven by the growing preference for natural and clean label ingredients in food products. Nisin, a natural antimicrobial agent derived from bacteria, helps extend the shelf life of food items by inhibiting the growth of harmful bacteria, yeasts, and molds. This addresses the consumer demand for safer and minimally processed foods. Additionally, the increasing focus on food safety and preservation techniques in the food and beverage industry is boosting the adoption of nisin as a preservative. However, challenges exist in terms of regulatory approvals and limitations on the maximum allowable usage levels of nisin in different regions. Stricter regulations and the need for comprehensive testing and documentation for safety and efficacy could pose challenges to market expansion. Balancing the benefits of nisin with regulatory compliance will be vital for its continued growth in the food industry.
