Abstracts

Radiopharmaceuticals (also known as radioactive drugs) are drugs that contain radionuclides that emit radiation. The distribution of the radiopharmaceutical within the body is determined by the physiochemical properties of the drug, the stability of the radiolabel, the purity of the radiopharmaceutical preparation, the pathophysiologic state of the patient, and the presence or absence of interfering drugs. Dynamic and static images of the distribution of the radiopharmaceutical within the body can be obtained using a g-camera or another suitable instrument appropriate for the radiopharmaceutical being imaged—for example, positronemitting radiopharmaceuticals.

Nuclear medicine is a medical specialty that allows modern diagnostics and treatments using radiopharmaceuticals original radiotracers. Radiopharmaceuticals are considered a special group of drugs and thus their preparation and use are regulated by a set of policies that have been adopted by individual member countries. In China, radioactive drug approval process is cumbersome, drug research and development cycle is too long and the high-end equipment of China mainly relies on imports, which restrict the development of nuclear medicine.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
