Abstracts

Ozone has strong oxidation performance. Oxygen atoms in ozone molecules have strong electron-philicity or proton-philicity. The decomposition of ozone will generate new ecological oxygen atoms and form hydroxyl radical $\cdot\text{OH}$ with strong oxidation in water to oxidize and decompose pollutants in water. Ozone catalytic oxidation technology is an efficient advanced wastewater treatment technology, which is a hot application in the field of wastewater treatment in recent years. Compared with ozone as a single oxidant, hydroxyl radical ($\cdot\text{OH}$) formed by ozone under the action of catalyst has a higher reaction rate with organic matter, stronger oxidation, almost all organic matter can be oxidized. Catalysts can catalyze ozone to directly oxidize organic matter in water to CO_2 and H_2O , or to oxidize and decompose large organic matter into small molecules, making it easier to degrade.

According to QYResearch's new survey, global Ozone Catalyst market is projected to reach US\$ 843.8 million in 2029, increasing from US\$ 644.5 million in 2022, with the CAGR of 3.9% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Ozone Catalyst market research.

The future of the high-performance material market looks promising with opportunities in the construction, automotive, electrical, and food & beverages applications. The global high-performance material market is expected to grow with a CAGR of 9% to 11% from 2023 to 2029. The major drivers for this market are high-quality components demand from designers are increasing, rising demand in end-use sectors, and increasing number of manufacturers and suppliers in the fluid handling industry.
