Abstracts

Perfluoroalkoxy (PFA) is a fully fluorinated translucent, slightly flexible polymer with a low coefficient of friction and outstanding antistick properties. This tough material resists stress cracking and attack by nearly all chemicals and solvents. PFA is also temperature resistant, making it ideal for use in both high and low temperature environments. PFA is chemically stable and has excellent dielectric strength.

PFA is a partially fluorinated copolymer of tetrafluoroethylene (TFE), the base material for PTFE, with a perfluoroalkoxy monomer (PFA). In the case of PFA the TFE and PFA do not combine in a ratio of 1:1 to give the straight -A-B-A-B-A-B- format, but combine in a ratio of 1:0.01 to give a copolymer of the format -A-A-A-A-A-A-B-A-A-A-A-A-A-B where there are approximately 100 A monomers for every B monomer.

In consumption market, the global sales value decreases with the 0.72% average growth rate. USA and Europe are the mainly consumption regions due to the bigger demand of downstream applications.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Perfluoroalkoxy (PFA) 3900 market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
